### PUBLIC HEALTH REPORTS

VOL. 38

MARCH 2, 1923

No. 9

### THE TRACHOMA PROBLEM IN THE STATE OF MINNESOTA.

By TALIAFERRO CLARK, Surgeon, United States Public Health Service.

The appointment of a Special Commission for the Blind by Governor Preus of Minnesota stimulated further inquiry into the trachoma situation in the State. Several surveys already made by the Minnesota State Board of Health, or by the State Board of Health in cooperation with other agencies, had revealed a very heavy trachoma infection among certain Indian bands in the State, and more or less widely scattered foci of infection among certain elements of the white population, which constitute a distinct menace to the visual health of the State. The results of these surveys are briefly outlined below for more ready comparison with the data collected during this investigation.

### The Trachoma Status in 1912 and 1913.

In the years 1912 and 1913 the writer participated in three investigations of the trachoma prevalence in the State of Minnesota. Two of them were made at the request of the State Board of Health, and one, while not originating in, was made in cooperation with the State Board of Health. A detailed report of these surveys, "An Investigation of the Prevalence of Trachoma in the State of Minnesota," is set forth in Reprint No. 134 from the Public Health Reports, June 27, 1913.

The first of these surveys was made in May, 1912, to define the reported prevalence of trachoma among the Indian population of the State, to determine whether or not the disease was spreading to the white population contiguous to the Indian reservation and, finally, to investigate the reported existence of trachoma among the miners on the Mesaba and Vermilion iron ranges.

A second survey, made in October and November, 1912, was made in compliance with the act of Congress approved August 24, 1912, enabling the Public Health Service, then the Public Health and Marine Hospital Service, to make a study of the prevalence of trachoma and other contagious and infectious diseases among the Indians of the United States.

A third survey, made in March and April, 1913, was made by the United States Public Health Service at the request of the Minnesota

32150°-23--1

March 2, 1923. 384

State Board of Health. This survey comprised examinations of school children, both public and parochial, at various points in the State, of the pupils of the State normal schools, of the students of the State Agricultural School at Minneapolis, of the inmates of the State penal and reformatory institutions, and of persons in the schools for the deaf, blind, and feeble-minded.

General results.—Owing to the fact that the second survey included many, if not all, of the Indians examined during the first survey, data relating to the preliminary Indian survey were not included in the general tabular consideration of the trachoma prevalence in the State. During the period covered by these investigations, 52,847 persons of all classes, including Indians, were examined for trachoma, and 610 cases of this disease in active form were discovered, constituting 1.15 per cent of the total number examined.

Only 77 cases of trachoma were found on examination of 49,305 white persons (a ratio of 1 to 640) in comparison with 533 cases observed among 3,542 Indians (a ratio of 1 to 7).

### I. TRACHOMA AMONG THE INDIANS OF MINNESOTA.

In the course of investigations made in October and November, 1912, Indian reservations and schools were visited at Grand Portage and Grand Marais, Vermilion Lake and Tower Reservation, Red Lake Reservation and schools, Nett Lake Reservation and Pelican Point, Leech Lake Reservation and schools, Cass Lake boarding school and Winnebigoshish Lake region, Mille Lacs nonreservation settlement, and Fond du Lac Reservation.

Of the 3,542 Indians examined, 15.05 per cent were found to have trachoma.

TABLE I .- Trachoma among the Indians of Minnesota.

Reservation and schools.	Tribe,	Number exam-		to have
		ined.	Number.	Per cent.
Fond du Lac Grand Portage and Grand Marais	Chippewa	182 143	2	1.00
Leech Lake	do	598 178	95 4	15. 89 2. 21
Nett Lake and Pelican Point	dodo	171 640 1, 323	117 272	18, 28 20, 56
White Earth Vermilion Lake Pipestone.	do	120 187	1 42	20.38
Total		3,542	533	15. 00

Trachoma among reservation Indians.—Of 2,582 Indians examined in a house-to-house canvass, exclusive of school children, 12.66 per cent were found to be suffering with trachoma.

Table II .- Trachoma among reservation Indians, exclusive of school children.

Reservation.	Number exam-		to have noma.
	ined.	Number	Per cent.
Fond du Lac Grand Portage and Grand Marais	162 143	2	1. 23
Leech Lake	458 178	63 4	13.76 2.25
Pelican Point	145 26 464	66	14. 22
Red Lake White Earth Vermillon Lake	970 36	192	19. 79
Total	2,582	327	12,60

It will be observed that the highest percentage of trachoma was found on the White Earth, Red Lake, and Leech Lake Reservations, 19.79, 14.22, and 13.76 per cent, respectively.

It is interesting to note that no trachoma was found in the course of this survey among the Indians of the northeastern section of the State, which includes the bands at Grand Portage, Grand Marais, Tower, and Nett Lake.

Trachoma in Indian schools.—The results of this survey point with suspicion to the Indian boarding schools as a factor in the spread of trachoma among the Indian population of the State.

Table III.—Trachoma in Indian boarding schools.

Name of school.	Pupils exam-		to have loma.
	ined.	Number.	Per cent.
Cass Lake	47	18	38, 30
Cross Lake	46 64	12 12	26. 08 18. 75

Total	833	193	23, 86

TABLE IV .- Trachoma in Indian day schools.

School.	Number of pupils.		to have loma.
	o papas	Number.	Per cent.
Fond du Lac Portersville, White Earth Squaw Point, Leech Lake Sugar Point, Leech Lake White Earth	20 29 17 12 46	0 1 0 2 10	0. 00 3. 45 0. 00 16. 67 21. 74
Total	124	13	10. 48

It may be observed in the foregoing tables that the incidence of trachoma in the boarding schools was, without exception, higher than that among the corresponding reservation Indians, exclusive of school children. It is very possible that the intimacies of boarding-school life afford excellent opportunity for the spread of infection in the schools; and the subsequent return of these infected children to their homes no doubt contributed still further to the spread of this disease among the Indian population.

Injury to vision caused by trachoma.—In order to show concretely the damage to vision caused by trachoma, records were kept in the course of this investigation of the amount of visual injury observed

among the Indians.

Table V .- Injury to vision among reservation Indians caused by trachoma.

Number examined	 	 	2, 582
Cases of trachoma	 	 	327
Number with marked injury to vision	 	 	41
Number blind from trachoma	 	 	19
Per cent of marked visual damage in trachoma cases	 	 	18.04
Per cent of visual damage in total examined	 	 	2. 32
Per cent of blind from trachoma in total examined	 	 	. 73

Owing to the lack of facilities for making examinations for the less obvious visual damage caused by trachoma, the above figures do not take into consideration the large amount of refraction defects that undoubtedly existed.

Trachoma in the public schools in the vicinity of Indian reservations.— There were found 77 children of mixed blood among the 1,428 school children examined at points contiguous to Indian reservations.

TABLE VI.

		Exar	nined.		of tra- found.		icious ses.

		1,351	77		3	2	4
janitors, etc.). Mixed-blood family		3	5				
		61	5				

Per cent of trachoma among mixed-blood pupils, 3.90.

It will be observed that 3.9 per cent of the children of mixed Indian parentage attending these schools were trachomatous, and that two cases of suspected trachoma were found among the white children. The potentiality of the increased contact of the two races in the schools (one of them heavily infected) in the spread of trachoma in the white population is obvious.

### II. TRACHOMA AMONG THE MINERS OF MINNESOTA.

Of the total of 1,711 miners who were examined in 1912, 34 of them, or 1.99 per cent, were found to have trachoma.

TABLE VII.—Trachoma among miners of the Mesaba and Vermilion Iron Ranges.

	Number	Trac	homa.	Per cent of
Location.	examined.	Positive.	Suspected.	trachoma:
Biwabik Bovey Chisholm	73 66	3	1	4. 11 6. 06
Chisnoim Coleraine. Ely	93 392	3	2	3. 23
Hibbing	710 65 310	8 7 7	4	1. 13 10. 77 2. 26
Total	1,711	34	11	1.99

No case of trachoma was observed among the 392 miners examined on the Vermilion Iron Range.

At the time of this survey it was pointed out that the cases of trachoma observed among the miners were very active, some of them being in the acute stage of the disease, and that the presence of such numbers of recent cases at the different locations was due to established foci of infection rather than to fresh importations.

Trachoma in the public schools of the Mesaba Iron Range.—Trachoma was observed in the schools in 4 of the 10 districts visited in 1912. In one instance there was traced a definite connection between infection in the school and infected miners.

### III. TRACHOMA IN SCHOOLS AND STATE INSTITUTIONS.

In an attempt to determine the trachoma index and locate foci of infection in communities more or less remote from Indian reservations, a survey was made by the writer during the period March 6-April 19, 1913. A total of 39,264 persons were examined in the 18 counties visited.

<sup>1</sup> Three in family of an uninfected girl attending school.

Only 9 cases of active trachoma were found among the 35,229 school children examined during this survey, and these were confined to 6 of the 18 counties visited. It seemed reasonable to conclude that trachoma, while present, was not alarmingly prevalent in the general white population of the State except in the mining region.

### The Trachoma Survey of 1918.

Itasca County.—At the request of and in cooperation with the State Board of Health, a trachoma survey of Itasca County, Minn., was made by Dr. L. L. Culp, representing the United States Office of Indian Affairs, assisted by Dr. W. P. Greene, epidemiologist of the Minnesota State Board of Health, during the summer of 1918. In the course of this survey, 2,346 persons were examined, of whom approximately 20 per cent were white, representing about 10 per cent of the total white population of the county. The Indians

examined comprised about 30 per cent of the Indian population. Practically all of these Indians dwell in the southwestern section of the county. The results of this survey are as follows:

TABLE X .- Results of the 1918 survey.

Number of country schools visited, 13; number in which Indians were found, 6.

Total number of persons examined, 2,346; trachoma cases found, 36; per cent of number examined, 1.34.

Koochiching and St. Louis Counties.—In August, 1918, Doctors Culp and Greene examined 148 of a total Indian population of 300 of the Nett Lake Agency at Pelican Point, Koochiching and St. Louis Counties, and found 2 positive cases and 1 suspected case of trachoma.

### The Present Status of Trachoma in Minnesota.

### TRACHOMA SURVEY OF DECEMBER 4-22, 1922.

Mindful of trachoma as a factor to be reckoned with in the prevention of blindness, and in further consideration of the potential increase in the number of children compelled to attend sight-saving classes because of the visual damage so common to this disease, should its spread remain unchecked, the State Board of Health determined to make a new survey to include a part of the territory covered by previous investigations and secure, for the purposes of the governor's commission, more recent information regarding the prevalence of trachoma in the State.

On request of the Board, two Federal medical officers, representing the United States Public Health Service and the United States Office of Indian Affairs, respectively, cooperated with the State Board of Health in this investigation. Since both of these officers participated in the former surveys here reported, the same standards of examination and diagnosis obtained in this as in previous investigations, and the results are, therefore, comparable.

Owing to the short time intervening before the Commission for the Blind was required to report, the period of the survey was necessarily brief, December 4-22, 1922. However, it is felt that the territory covered by the survey and the number of examinations made are representative. March 2, 1923. 390

General results.—In the course of this survey, 104 schools (in 11 counties) were visited, and 13,157 white children and 762 Indians were examined for trachoma. Among these the ratio of positive trachoma cases observed was 1 to 18 for the Indian and 1 to 387 for the white children (see appendix, résumé of Table I). Of the cases of suspected trachoma, the ratio was 1 to 152 for the Indians and 1 to 692 for the whites, respectively. In this, as in previous surveys, the greatest amount of trachoma was observed among the Indian population, and in the public schools on the Cuyuna and Mesaba Iron Ranges (see appendix, Table II).

Trachoma in the public schools in the vicinity of Indian reservations.—
Owing to the inclemency of the weather at the time of this survey, and the necessity for haste, no house-to-house canvass of the Indian population, as was made in previous surveys, was attempted, the investigation to determine the prevalence of trachoma among the Indian population and the danger of its spread to the white people being limited to the examination of children in schools attended by

both races.

The results of this survey show very clearly the continued menace of the Indian population to the visual health of the State. Moreover, the danger of spread of trachoma by the Indian seems to be increasing by reason of the increasing opportunity of the two races for contact, especially in the schools. In fact, this survey shows a very material increase in the number of Indian children attending public schools that are attended also by white children. In 1912 the ratio of Indian to white children examined in the public schools in Becker, Cass, and Mahnomen Counties was 1 to 18. In 1922 the ratio in 15 schools visited in Becker, Beltrami, Cass, and Mahnomen Counties was approximately 1 to 3. Furthermore, in 1912, 3.8 per cent of the Indian children examined in the public schools in the vicinity of Indian reservations were trachomatous, whereas in 1922 6.3 per cent of them were found infected (see appendix, Tables III, IV, V, and X, and Table VI, pp. 398, 399 and 401).

The territory adjacent to Mille Lacs formerly harbored a much greater number of Indians than now, but even here, as revealed by this survey, the opportunity for contact of the two races in the schools is not negligible. No trachoma was found among the few Indians examined in this region during this survey, but 4 positive cases and 2 suspected cases of trachoma were found among 837 children examined in the schools surrounding Mille Lacs (see appendix, Table XI). It is a reasonable supposition that trachoma has existed in this section for a number of years, and the probability is strong that the original nidus of the infection was the Indian population, as is apparently the case in the other communities contiguous to Indian reservations reported above. In fact, in 1912, 2.24 per cent of the Indians examined in this region were suffering with active trachoma.

In the public school at Sawyer, located about 12 miles from Cloquet, 33 Indian and 39 white children were examined, and 3 Indian children and 1 white child were found to have trachoma (see appendix, Table VI). Furthermore, as forecasted by the survey of 1912 and 1913, trachoma was found to have spread to the Nett Lake Reservation, where previously no trachoma had been observed (see appendix, Table XIII).

Trachoma in the public schools of the iron ranges.—Owing to the winter season, the mines had closed down and no opportunity was afforded for the examination of individual miners during this investigation. However, a total of 4,712 white school children were examined in St. Louis County, 2,475 boys and 2,237 girls, and 10 positive cases and 1 suspected case of trachoma were observed among the boys, and 8 positive and 4 suspected cases among the girls, or approximately 0.4 per cent of the total number examined (see appendix, Table XIII).

In 1912 there were examined 4,585 children in the public schools at Biwabik, Chisholm, Eveleth, Gilbert, and Hibbing. Of this number, 7, or 0.15 per cent, had trachoma. In the course of the present survey 2,800 school children were examined at these same locations, and 12 cases of trachoma, or 0.43 per cent of the total examined, were found.

Considered as a whole, there is at present more trachoma among the school children of the Mesaba Range than there was in 1912.

On the Cuyuna Range, 4 positive cases of trachoma and 2 suspected cases were found on the examination of 770 children in 5 schools. It is pleasing to note that no cases were found in the near-by school at Crosby where 394 children were examined (see appendix, Table VII). However, owing to the existence of foci of infection so close by, it is highly probable that in time this disease will make its appearance in the schools at Crosby unless the necessary steps be taken for the control of trachoma on this range.

Trachoma in the general school population.—The results of this survey tend to confirm the findings of previous investigations that there is no unusual trachoma problem in Minnesota outside of certain fairly well-defined districts.

No trachoma was found on the examination of 617 school children in 8 schools in Aitkin County.

At Cloquet, in Carlton County, the 1,243 children, including 18 Indians, examined in the parochial and public schools were all free from trachoma. However, as stated elsewhere in this report, cases of the disease were observed in the public school at Sawyer, in Carlton County, which is attended by both Indian and white children in nearly equal numbers.

In Crow Wing County no trachoma was found in the schools visited, except in those of the range towns and at Nokay Lake in

the Mille Lacs region.

Trachoma is still found in Dakota County at South St. Paul, where cases were also observed in the survey made in 1913. In the present survey, 1 positive and 1 suspected case of trachoma were observed among 804 children in the second to sixth grades, both inclusive. It is very evident, therefore, that a focus of infection which is not yet under control has been existing at this point for a number of years.

Trachoma in State institutions.—A total of 1,319 inmates of 3 State institutions at Faribault were examined for trachoma, 81 in the school for the blind, 1,012 in the school for the feeble-minded, and 226 in

the school for the deaf (see appendix, Table XII).

No trachoma was found among the pupils of the school for the deaf. However, 1 positive and 1 suspected case of trachoma were observed in the school for the blind, and 6 positive and 3 suspected cases in the school for feeble-minded. The total number of pupils examined in this latter institution at the time of this survey was proportionately less than that examined at the time of the previous survey, in 1913, when 10 positive cases and 1 suspected case were noted. It is believed that a more detailed survey than was possible on this occasion (owing to the lack of time) would reveal still other cases. The results of this examination at the school for feeble-minded indicate that trachoma has continued to exist in this institution since the time of the previous survey, and point to the adoption of stringent measures for its elimination.

### Conclusions.

The investigations just completed tend to confirm the conclusions and fulfill the prophecy in regard to the prevalence and future spread of trachoma based on the investigations of 1912 and 1913. They are as applicable to the present situation as then. These conclusions, in part, are quoted below, each followed by appropriate comment based on an analysis of the present study.

1. "Trachoma is unduly prevalent among the Indians of Minnesota."

An undue percentage of the Indians attending the public schools are afflicted with this disease, pointing to a rather heavy infection among the general Indian population.

2. "There is a possibility that the Indians of the northeastern section of the State may become infected through association with infected districts, with improvement of facilities for intercommunication."

Although no trachoma was observed at the Nett Lake Reservation at the time of the original surveys, the disease was observed among the Indians of this section at the time of the survey made by the State Board of Health in 1918 and also during the present investigation, 1922. It is very evident, therefore, that not only did trachoma gain entry to this population as predicted, but it has continued to exist therein for a period of four years.

3. "The heavily infected Indian reservations are a threatened source

of danger to the public health of the State."

This is evidenced by the increased number of cases of trachoma observed in the course of this survey among the Indians attending the public schools contiguous to Indian reservations.

4. "The Indian is coming into closer contact with the white population with increased opportunity for the spread of trachoma through improvement in lines of communication, the purchase and settlement of allotted Indian lands by white settlers, and the organization of counties within the boundaries of Indian reservations."

With but one exception the former Indian reservations within the State have been incorporated into and become an integral part of county organizations. The larger provision of school facilities and the extension of good roads to these districts in recent years have greatly multiplied the opportunities for contact between the two races.

5. "Children of mixed parentage are attending the public schools

contiguous to reservations in considerable numbers."

In the course of this investigation the percentage of Indians found attending the public schools is practically double that observed during the earlier investigations.

6. "The Federal Government will sooner or later relinquish its guardianship of the Indian; therefore conditions of health reducing his future economic usefulness is a matter of present concern to the State authorities."

Only the Indians of the Red Lake Reservation are now wards of the Government. The responsibility for the control of infection among the former wards of the Government now rests with the State.

7. "More trachoma is found in the public schools of the Mesaba Range than among the white pupils of the public schools contiguous to Indian reservations; there is, therefore, greater danger of the disease spreading from this source at present than from Indian reservations."

While this survey revealed a higher percentage of trachoma in the public schools of the mining sections of the State than among the white children attending mixed schools, nevertheless the increased number of infected Indian children and the growing number of Indian children attending the public schools also attended by white children, as shown by this survey, indicate that in the near future the situation will be reversed unless proper control measures are instituted.

8. "The trachoma situation in the mining region of the State is a pressing public health problem demanding immediate solution."

The results of the present survey confirm this conclusion in the most emphatic manner. Trachoma has increased in the schools on the Mesaba Range from 0.15 per cent in 1912 to 0.43 per cent in 1922.

9. "Trachoma is not prevalent to an alarming degree in the State of Minnesota outside the Indian reservations and the mining region."

Although this survey was not as extensive as that made in 1913, and was confined in large part to the investigation of trachoma in the schools of the mining sections of the State and in the mixed schools contiguous to Indian reservations or former reservations, still the relatively large number of children attending other schools examined lends strong support to the belief that very little trachoma will be found in the State outside of fairly circumscribed localities and certain State institutions.

### Recommendations.

The following recommendations based on the results of the present survey are, in a large part, similar to those previously made in the report of the original survey, changed only to conform to the additional information now available relating to the trachoma situation in the State and to a better knowledge of the methods of control. They relate in part to education and investigation, and in part to treatment.

1. An educational campaign should be inaugurated properly to inform the citizens of the State of the injurious effect of trachoma on vision, its curability, and the methods of prevention and control.

2. The regulations of the State Board of Health mandatorily requiring notification of trachoma should be more strictly enforced, and a strong attempt should be made to enlist the cooperation of the physicians of infected districts in detecting existing cases and in eliminating foci of infection.

3. A detailed trachoma survey of the entire Indian population of the State should be made, including isolated Indian bands, for the purpose of locating every infected Indian within the State, with the view of securing proper care of and attention to individual cases and of preventing the further spread of the disease.

4. A careful examination should be made of every child enrolled in the public schools contiguous to the Indian reservation and in those at the different mining locations in the State, and the name and address of every infected child should be recorded and notified to the State Board of Health for such action as may be necessary for the ultimate elimination of this disease from the school population and the homes of these districts.

5. A complete examination of the eyes of every inmate confined in or attending a State institution should be made to detect cases of trachoma for the purpose of insuring prompt and adequate treatment.

6. A mobile trachoma unit should be organized at State expense and authorized to travel to infected points for the purpose of giving necessary treatment and familiarizing the local physicians with the most recent and effective methods of cure.

7. Arrangements should be perfected whereby certain hospitals located at strategic points, from the standpoint of trachoma prevalence, may be utilized, at State expense when necessary, for the hospitalization of infected cases requiring hospital treatment occurring in the white population.

8. In order more effectively to eliminate trachoma in the district formerly comprising the White Earth Indian Reservation, a hospital should be operated by the State at some readily accessible point in this district for the proper management of all trachoma cases found among the former wards of the Government.

9. A cooperative arrangement should be entered into with the United States Office of Indian Affairs for the purpose of enforcing measures necessary for the control of trachoma among that portion of the Indian population of the State remaining under Government guardianship; otherwise, owing to improved facilities for intercommunication, the elimination from the nonreservation population will be greatly complicated, if not impossible.

### APPENDIX.

# Tabulated Report on Trachoma Survey in Minnesota, December 4-22, 1922.

By TALIAFERRO CLARK, Surgeon, United States Public Health Service, and L. L. CULF, M. D., Office of Indian Affairs, cooperating with the Minnesofa State Board of Health.

### ORDINANCE REQUIRING HEALTH CERTIFICATES OF PERSONS WORKING IN FOOD ESTABLISHMENTS UPHELD.

In a habeas corpus proceeding 1 the Court of Criminal Appeals of Texas has held valid an ordinance of the city of Dallas requiring of any person who works in a food establishment a health certificate showing that such person has been examined by a reputable physician and found free from any communicable disease. The ordinance made proprietors of food establishments subject to the medical examination, and the person who sought the writ of habeas corpus was the proprietor of a meat market who had been convicted for having worked in the establishment without having a health certificate.

### HEALTH FILMS RECENTLY ISSUED BY THE NATIONAL HEALTH COUNCIL.

In view of the fact that the United States Public Health Service is unable to meet the demands made upon it for films on health subjects, it will be of interest to health workers to learn that the National Health Council has recently prepared and published a comprehensive list of educational health films.

More than 300 titles are included in the list, which gives, in addition to the title, the number of reels, or the length of the film; the name of the distributor; the rental or sale price, or both; and a brief note about the subject matter of the film. The titles are classified under Child hygiene, Personal hygiene, Public hygiene, Communicable diseases, Other diseases, Nursing, Anatomy and Physiology, etc., and Miscellaneous. The film list will be sent to any

<sup>1</sup> Ex parte Vaughan, 246 S. W. 373.

person or institution interested in motion pictures on health subjects, but it is intended especially for public health workers, connected with official and voluntary agencies. A charge of 35 cents a copy is made for the list in order to cover part of the cost of preparing it.

The development of educational health material is one of the important activities of the National Health Council, which is an organization composed of the leading national voluntary health agencies of the country and having for its aim the interrelation of the work of those agencies for the betterment of health work in the United States. In addition to the collection of information concerning health films, the National Health Council, through the health films committee, is making a study of existing films and is encouraging in numerous ways the production of better health films. The health films committee has already reviewed and analyzed six motion pictures on health subjects and has offered to the producers of these films suggestions as to how the films might be improved. Numerous other films are scheduled for study by especially selected subcommittees.

In general it is the purpose of the committee on health films of the National Health Council to encourage the wider use of the best health films and to stimulate the production of better motion pictures on health subjects.

The published list and other information may be secured by addressing the National Health Council, 370 Seventh Avenue, New York City.

### DEATHS DURING WEEK ENDED FEBRUARY 17, 1923.

Summary of information received by telegraph from industrial insurance companies for week ended February 17, 1923, and corresponding week of 1922. (From the Weekly Health Index, February 20, 1923, issued by the Bureau of the Census, Department of Commerce.)

,	Week ended Feb. 17, 1923.	Corresponding week, 1922.
Policies in force	51, 498, 269	48, 386, 013
Number of death claims	11, 153	8,862
Death claims per 1,000 policies in force, annual rate	11.3	9.6

Deaths from all causes in certain large cities of the United States during the week ended February 17, 1923, infant mortality, annual death rate, and comparison with corresponding week of 1922. (From the Weekly Health Index, February 20, 1923, issued by the Bureau of the Census, Department of Commerce.)

### PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

### UNITED STATES.

### CURRENT STATE SUMMARIES.

These reports are preliminary, and the figures are subject to change when later returns are received by the State health officers.

### Reports for Week Ended February 24, 1923.

### SUMMARY OF CASES REPORTED MONTHLY BY STATES.

The following summary of monthly State reports is published weekly and covers only those States from which reports are received during the current week:

State.	Cerebrospinal meningitis.	Diphtheria.	Influenza.	Malaria.	Measles.	Pellagra.	Poliomyelitis.	Scarlet fever.	Smallpox.	Typhoid fever.
JANUARY, 1923.  Delaware	1 15 3 2 1 2 1 2 8 16 4 2	21 1, 697 571 461 397 466 99 131 886 1, 673 261 116	210 1,032 132 1,153 4,018 1 48,240 193 345 2,601	3 2,665	405 1 2, 154 800 146 764 680 2, 303 38 5, 67 1, 678 18	121	5 1 2 1 4 2 1 17 17	53 30 1, 556 417 591 396 1, 239 33 277 978 92, 482 207 250	28 367 254 30 398 41 20 64 351 188	3 1 65 10 15 24 15 47 7 21 142 30 36

### RECIPROCAL NOTIFICATION.

### January, 1923.

Cases of communicable diseases referred during January, 1923, to other State health departments by departments of health of certain States.

State referred by.	Diph- theria.	Para- typhoid.	Polio- myelitis.	Scarlet fever.	Small- pox.	Tuber- culosis.	Typhoid fever.

See p. 420; also Current State summaries, p. 408.

### CITY REPORTS FOR WEEK ENDED FEBRUARY 10, 1923—Continued.

#### TYPHOID FEVER.

The column headed "Median for previous years" gives the median number of cases reported during the corresponding week of the years 1915 to 1922, inclusive. In instances in which data for the full eight years are incomplete, the median is that for the number of years for which information is available.

City.	Median for pre-		ended 10, 1923.	City.	Median for pre-		ended 0, 1923.
